*Wildlife Corridors: Permeability rankings were developed to evaluate the resistance of the underlying landscape to movement of wildlife species. Areas of high permeability between the isolated habitats within the Santa Monica Mountains, Puente Hills and Angeles National Forest - known which have high permeability potential community for species. Permeability values range from low (red) to high (green) as shown. Recurring likely movement corridors between habitat areas within these ridges provides critical habitat linkages which would otherwise be lost to urban sprawl. Habitat suitability for target species is numerous through, additionally maintaining this critical corridor provides linkages to other habitat areas outside the Study Area. Private lands these Corridors were not analyzed.

Density of Target Species: aggregation of target species habitat suitability models. Areas of high density (red) reflect a higher density of target species are represented by a higher concentration of yellow tone.
